

*(Figure 4: Gold nuggets recovered from the upper gold-bearing conglomerate at Cannonball Gully-top and 150S-middle and from the Purdy's Reward conglomerate-bottom. Rock matrix is adhered to most nuggets. Nuggets from the upper gold-bearing conglomerate bed at Comet Well range in size from a few tenths of a gram to as large as 8 grams, similar to the range in size among nuggets found at Purdy's Reward. Like those at Purdy's Reward, they display a halo of secondary fine-grained gold intergrown with chlorite.)*
