

Here's what **The Visionaries** are Saying about GoodCell

All of our cells become specialized cells.

This is particularly evident in the blood where stem cell therapies can fully restore all blood and immune cells. We now have the tools to take some of those cells, rewind their history to an earlier, stem cell stage, then guide them forward on an updated trajectory that meets a patient need.

— **Dr. David Scadden**, Co-Founder, Harvard Stem Cell Institute

The GoodCell Founders anticipated the success of cell and gene therapies and therefore created Personal Biobanking, a proactive approach allowing individuals to store their healthiest cells now. In doing so, people could benefit from continued scientific breakthroughs in the future. There are 23 FDA approved cellular and gene therapy products that exist today and thousands of cell and gene therapies in clinical trials,

the list will continue to grow.

— **Salvatore Viscomi**,
MD, Chief Medical Officer

— **Jennifer Joe**, Founder of Medtech Boston, CEO of Vanguard Health

The focus of my work is the digitization of healthcare and how we harness the information age for the benefit of all people. We're living in a very exciting time where GoodCell is putting the power of that data in patients' hands and allowing them to access not only their own health information, but also their stored cells for future treatments should they need them.

**This is clearly the next step in the
patient advocacy movement.**
