

Interview with Josip Heit on the Topic of Blockchain

Josep Heit, Chairman of the Board of the GSB Gold Standard Corporate, was interviewed on the topic of blockchain by Deutsche Tageszeitung - Ressort Technik.

Preview of the interview:

Q: Mr Heit, is blockchain or your G999 Blockchain technology <https://g999main.net> only something for business sectors or can private users also benefit from blockchain?

A: Josip Heit: "Well, at the moment, according to a Deloitte study I have (Deloitte is an international company in the business sector and provides services in the areas of auditing / editor's note), mostly large companies are taking a leading role in the implementation of blockchain technologies, but I am of the opinion that soon medium-sized companies will also be able to participate in the success of the technology and here, in particular, the private user will benefit from the blockchain. "

Q: Mr Heit, Once entered into the blockchain, data cannot be manipulated afterwards, but how does the protection against manipulation by the blockchain work?

A: Josip Heit: "Quite simply, characteristics of a file are stored in the blockchain in an audit-proof and tamper-proof manner, whereby, among other things, not only documents are digitally logged, even after many years, the processes are stored in a tamper-proof and traceable manner.

An entry in a file can therefore also serve as clear evidence for a copyright dispute over an invention or a musical work. The blockchain could also create an automatic receipt documentation, which, for example, not only stores an invoice, but also checks it and proves to the customer by means of a real-time check that it is a product made by the manufacturer and not a plagiarism."

Q: Mr Heit, the coronavirus, with its various murderous mutations, currently has our planet firmly in its grip. Can the blockchain help to eliminate this deadly virus?

A: Josip Heit: "You don't have to be a soothsayer or believe in lighthouse projects when you can already say today that, for example, tourism will only go in the foreseeable future with a digital proof of identity linked to vaccination confirmations or negative test results - realised through a combination of blockchain and biometrics, thus blockchain will have a significant impact on defeating the coronavirus."

Q: Mr. Heit, you once said: "Blockchains in their most basic form, the most accurate database imaginable!" Your CTO (Chief Technical Officer) Alexandru Cocindau, elaborated that in today's world it would be important to store one's data, whether personal or professional, in an audit-proof way, to exclude any data manipulation or to prove the authorship of a product, as in almost all economic sectors the Blockchain would gain more and more users. [SEP] In recent years,

blockchain has made a convincing transition from an experimental technology to an integral part of corporate organisational innovation.

What innovations do you see in the future for this technology, Mr Heit?

A: Josip Heit: "The GSB Group is currently working on a development called "GSmedia", which will change the news world in a network of large news agencies in the same way that the internet began to influence the press landscape only years ago. Against this background, the GSB Group has currently concluded contracts with groups from the news sector. If you consider that just a few years ago people took most of their daily news from politics, business, technology, sports, tabloids and culture - from printed newspapers, you have to say clearly and unequivocally in this day and age: printed newspapers are yesterday's news! Here I am talking about newspaper publishers whose traditional print business is weakening more and more every year.

The development departments of the GSB Group will, for the first time, make the information of various leading news agencies on the entire planet compatible with the development and introduction of a wrap protocol, which will ensure GSmedia and its partners an information advantage in the press and news sector, which has not existed in this form before."

In addition, the GSB development department is working on a future-oriented product called "Bitco World".

This product, when development is complete, will help address the current post Zero Hour crisis, the end of the coronavirus pandemic, which is about discovery and the ability to connect products. I will tell you more shortly in an official statement from our group when development has progressed, but be assured already, you will be excited!"
