

Canada's Oil Sands. Net Zero by 2050.

Challenge accepted.

Achieving net zero emissions is no small task. But we're up to it. A 22% reduction in emissions intensity over the past decade is a good start. A joint commitment to reach net zero emissions by Canada's six largest oil sands companies — representing more than 95% of oil sands production — is even better. Using carbon capture and storage and advancements in cleantech, Canada's oil and gas industry can help lead the world along the path to a net zero future.
